Appendix PG-1: Pedestrian Wind Impact Assessment Protocol

Background

This protocol provides guidance for the preparation and review of pedestrian wind impact assessments, including detailed assessment methodologies and local wind climate data, as well as wind mitigation measures. It is intended to ensure enhanced consistency and accountability in the development approval process.

Buildings taller than their immediate surroundings are exposed to stronger winds at higher elevations. These winds can be redirected down by building walls and can subsequently accelerate around exposed building corners and along the gaps between buildings, resulting in high wind activity in pedestrian areas (Diagram PGA1-1).

Diagram PGA1-1: Typical wind flow patterns around buildings

Increased wind speeds may affect pedestrian comfort and safety on and around a proposed development and, therefore, a project's success. The potential wind impact can be assessed through an experience-based review and computer simulations. If a negative wind impact is predicted, mitigation strategies shall be developed.

Qualitative Assessments

When an application is made for a new building or an addition to an existing building higher than 20.0 metres, a pedestrian wind impact assessment shall be conducted. Table PGA1-1 shall be used as a guide in the determination of an appropriate assessment approach for the proposed development.

A qualitative assessment of wind conditions, including a letter of opinion and a desktop analysis, is largely based on wind consultants' knowledge of wind flows around buildings, local wind climate, and experience with wind tunnel tests on similar building projects in the Halifax Regional Municipality. A desktop analysis may involve using numerical tools to predict wind conditions around simplified building forms. It may also use Computational Fluid Dynamics (CFD) software to visualize the flow patterns for select (or all) wind directions (Diagram PGA1-2).

The qualitative assessments shall cover key pedestrian areas on the development site and around the adjacent street blocks, typically including building entrances, sidewalks/walkways, bus stops, outdoor restaurant uses, parks, playgrounds, roof terraces, and so on.

Table PGA1-1: Assessment Approach According to the Proposed Building Height

Proposed building height	Assessment approach
20 to 40 metres, with the same or taller surroundings	An experience-based letter of opinion sufficient to: (a) identify any building design issues; and (b) provide conceptual solutions for wind control, where needed.
20 to 40 metres, with lower surroundings	For a qualitative assessment and to provide wind mitigation strategies, an experience-based desktop analysis using numerical tools, including CFD.
> 40 metres	For a qualitative assessment and to provide wind mitigation strategies, an experience-based desktop analysis using numerical tools, including CFD.

Diagram PGA1-2: An example of computer simulation (CFD) of wind flows around buildings

The assessment of pedestrian-level wind conditions should be conducted as early as possible, when building massing can still easily be altered for wind control, if necessary.

Local Wind Climate Data

Long-term data from Shearwater Airport (Diagram PGA1-3) shall be used as a reference for the wind assessment of projects in the Halifax Regional Municipality. The data shall be grouped into two seasons: summer (May to October) and winter (November to April), to account for the distinct differences in pedestrian outdoor activity during these two periods.

Summer (May to October)

Winter (November to April)

Diagram PGA1-3: Seasonal distribution of winds approaching Shearwater Airport (1988–2017)

To obtain full-scale wind speeds and exceedance frequencies, wind data measured at the airport over the latest 30 years (or longer) shall be converted to a reference height above the study site and combined with the wind speeds predicted by desktop analysis.

Mitigation Strategies

Wind mitigation may be required for areas where wind conditions are unsuitable for an intended pedestrian use. The most effective wind control measures involve adjustments to the building early in the design process (e.g., massing, shape, and orientation changes) that respond to the local wind climate. These can be assisted by tower setbacks, large podiums, tower shapes, corner articulations, colonnades/arcades, and so on, as illustrated by photos in Diagram PGA1-4.

Diagram PGA1-4: Examples of large-scale wind control features

Smaller-scale measures such as canopies, trellises, wind screens, and street-level public art can also be used for local wind control. Soft landscaping elements, especially coniferous and marcescent species, are commonly used to reduce wind conditions to appropriate levels throughout the year; deciduous soft landscaping is most effective during the summer months. The use of soft landscaping for wind control requires consideration of species, size, and viability in the predicted local microclimate (i.e., sustainability in a windy environment). Diagram PGA1-5 shows several examples of design and soft landscaping features used for wind control.
